# Manage cluster mediators

## Cluster mediators endpoint overview

### Overview

You can use this API to add or remove a mediator to MetroCluster over IP configuration, or get the status and details of the existing mediator in MetroCluster over IP configuration. The GET operation returns the status of the mediator along with the mediator details. The DELETE operation removes the mediator. The POST operation adds the mediator.

### Adding a mediator

A mediator can be added to MetroCluster over IP configuration by issuing a POST on `/cluster/mediators`. Parameters are provided in the body of the POST request. There are no optional parameters for adding a mediator.

#### Required configuration fields

These fields are always required for any POST `/cluster/mediators` request.

- `ip_address` - Specifies the IP address of the mediator.
- `user` - Specifies a user name credential.
- `password` - Specifies a password credential.

#### Polling the setup job

After a successful POST `/cluster/mediators` is issued, an HTTP status code of 202 (Accepted) is returned along with a job UUID and a link in the body of the response. The setup job continues asynchronously and can be monitored by using the job UUID and the `/cluster/jobs` API. The "message" field in the response of the GET `/cluster/jobs/{uuid}` request shows the current step in the job, and the "state" field shows the overall state of the job.

### Deleting a Mediator

A mediator can be deleted from MetroCluster over IP configuration by issuing a DELETE to `/cluster/mediators/{uuid}`. Parameters are provided in the body of the DELETE request. There are no optional parameters for adding a mediator.

#### Required configuration fields

These fields are always required for any DELETE `/cluster/mediators/{uuid}` request.

- `user` - Specifies a user name credential.
- `password` - Specifies a password credential.

#### Polling the delete job

After a successful DELETE `/cluster/mediators/{uuid}` is issued, an HTTP status code of 202 (Accepted) is returned along with a job UUID and a link in the body of the response. The delete job continues

asynchronously and can be monitored by using the job UUID and the /cluster/jobs API. The "message" field in the response of the GET /cluster/jobs/{uuid} request shows the current step in the job, and the "state" field shows the overall state of the job.

## Examples

### Setting up a mediator for a 4-Node MetroCluster over IP Configuration

This example shows the POST body when setting up a mediator for a 4-Node MetroCluster over IP configuration. The only prerequisite is that MetroCluster over IP is configured.

```
# API
/api/cluster/mediators
```

### POST body included from file

```
mediator_post_body.txt:
{
  "ip_address": "1.1.1.1",
  "user": "username",
  "password": "password"
}
curl -X POST https://<mgmt-ip>/api/cluster/mediators -d
"@mediator_post_body.txt"
```

### Inline POST body

```
curl -X POST https://<mgmt-ip>/api/cluster/mediators -H "Content-Type:
application/hal+json" -d '{"ip_address": "1.1.1.1", "user": "username",
"password": "password"}'

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description

## records

Performance numbers, such as IOPS latency and throughput.

Name	Type	Description
_links	<a href="#">_links</a>	

Name	Type	Description
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	<a href="#">iops</a>	The rate of I/O operations observed at the storage object.
latency	<a href="#">latency</a>	The round trip latency in microseconds observed at the storage object.
status	string	Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	<a href="#">throughput</a>	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

error\_arguments

Name	Type	Description
code	string	Argument code

error

Name	Type	Description
arguments	array[ <a href="#">error_arguments</a> ]	Message arguments

target	string	The target parameter that caused the error.
